

TASK 3: Animal Species Data

About Dataset

This dataset is well-suited for basic exploratory analysis, allowing users to identify patterns and generate initial insights.

It provides a snapshot of various animal species, focusing on key biological traits and ecological context. While limited in size, it offers enough variety to support basic analysis in areas such as behaviour, habitat distribution, and conservation status.

Dataset Overview

The Animal Traits and Habitats dataset includes a curated selection of animals, capturing essential details like type, speed, weight, lifespan, and threat level. It also includes information on geographic distribution and reproductive behaviour. Though modest in scale, the dataset is suitable for exploratory studies and educational projects.

Key Details

Total Entries: 500 rows, each representing a distinct animal.

Columns: 10 columns, including:

- Animal Type – Classification such as mammal, bird, reptile, etc.
- Animal Name – Common or scientific name.
- Speed – Typical movement speed.
- Weight – Average body weight.
- Continent – General location by continent.
- Country – Specific countries of habitat.
- Lifespan – Average life expectancy.
- Migration – Whether the species migrates.
- Reproduction – Reproductive traits or methods.
- Threat Level – Conservation status or risk level.
-

TASK 4: Employees stress level dataset

About Dataset

This dataset contains 3,000 synthetic records representing software employees working across various states in India. The goal is to analyze factors influencing stress levels based on attributes like working hours, job satisfaction, sleep, exercise, social habits, and work environment.

Key Features:

Work-related: Average working hours, remote work type, deadline pressure, and manager support.

Lifestyle: Sleep and exercise habits, social scale, and living situation.

Demographics: Working location across Indian states.

Target variable: Stress_Level (1 to 5)
